

# Clinical coding application for Day Hospitals

# VisiCODE

VisiCODE is a web-based clinical coding application developed by Resolutions for day hospitals, small private hospitals and day units. VisiCODE will improve your business performance by improving cash flow, reducing costs and ensuring efficient and accurate coding.

## Code & invoice on discharge to improve cash flow

VisiCODE gives you the flexibility to code anytime, anywhere. Some of our clients code and bill within 2 hours of discharge. This gives you the benefit of better cash flow for your business.

## Coding by anyone at anytime

Business continuity is assured. VisiCODE facilitates the coding process without reliance on qualified coding staff. The simple automated process can be used by any staff in your facility, such as reception or billing staff. The application is overseen by Resolutions' qualified coders, ensuring all health fund requirements are met.

## Reduce costs of coding

As VisiCODE is a simple tool that can be used by any staff member, it eliminates the HR costs and issues associated with employing a clinical coder, such as recruitment, leave cover, entitlements and replacement. Facilities are not faced with the challenges of staff availability and reliability.

## Cost-effective web-based application

VisiCODE is a licensed web-based application which means facilities do not need to purchase expensive coding software or install software on their computer systems. Being web-based also provides the flexibility to use the application on any device.

## Accurate coding by automated system

Validations built in to this automated system eliminate human error. This means users are only able to select procedures that are relevant to the diagnosis that has been entered. Searching for diagnoses and procedures can be simplified by cross-referencing the terminology used by your clinicians to match the correct ICD-10-AM descriptors.

## Facilitates data collection of quality standards for accreditation

VisiCODE has an additional built-in feature of enabling the user to collect data on the current quality standards at the end of the coding process using the same source documents. This saves your facility time and money to meet your accreditation requirements.
